# Introduction to JavaScript

CSEC WEB DIVISION

---

# Outline

What is Javascript?

What you can do with it

Syntax

---

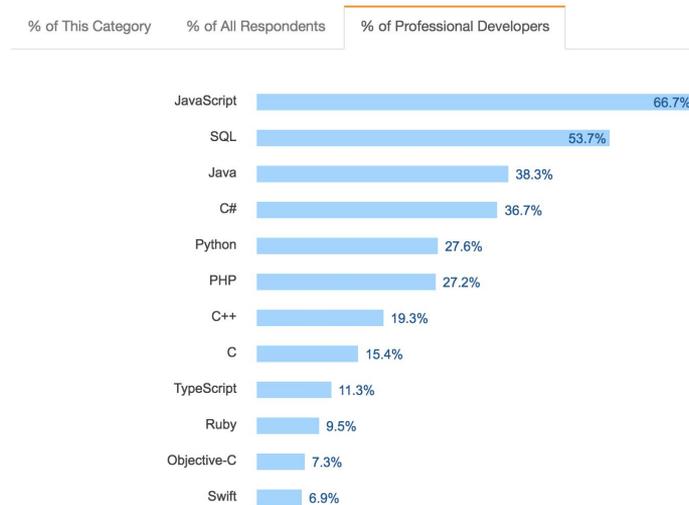

# What is JavaScript?

# An object oriented scripting language!

It is one of the most popular programming languages in the world among developers.

Source: StackOverflow developer Survey

## Programming Languages

# JavaScript is used to program the behavior of web pages

- HTML is used to define the content of web pages
  - ◆ Eg. Headings, buttons and containers
- CSS to specify the layout of web pages
  - ◆ Eg. the visual styling of webpages

**Ok but what is a scripting language and what does it have to do with Java?**

---

**No not at all!  
JavaScript has  
nothing to do  
with Java**

**A scripting language is an interpreted language and does not need to be compiled to run. Some key differences from scripting to programming languages are:**

1. Used to automate certain tasks in a program
2. Used to extract information from a data set
3. Has less code intensive as compared to traditional programming languages
4. Usually slower than compiled languages

---

## However....

- JavaScript can also be a programming language
- Modern browsers come with a Javascript compiler
  - ◆ E.g Google Chrome with it's V8 Javascript Engine

---

**So what can you do with it?**

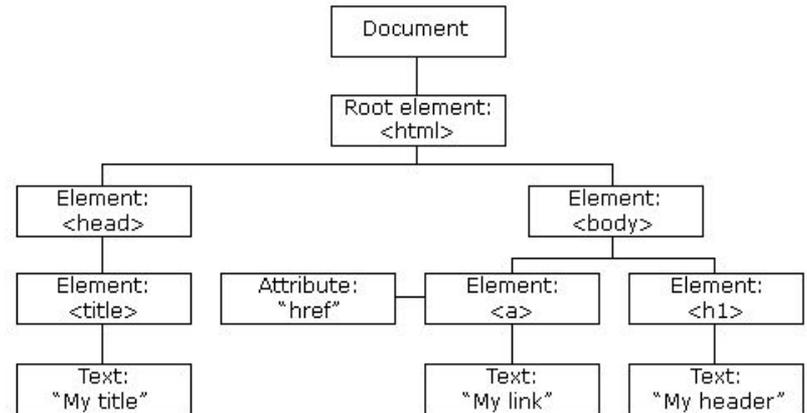

# Websites!

## 01

Javascript can manipulate data in HTML and CSS using DOM

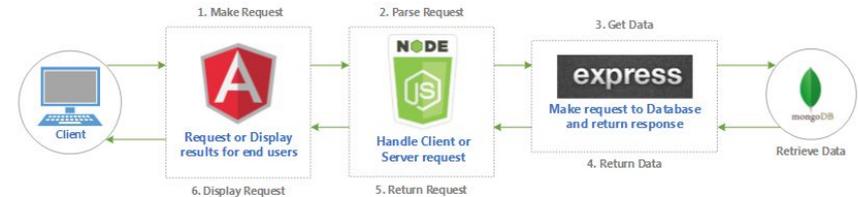

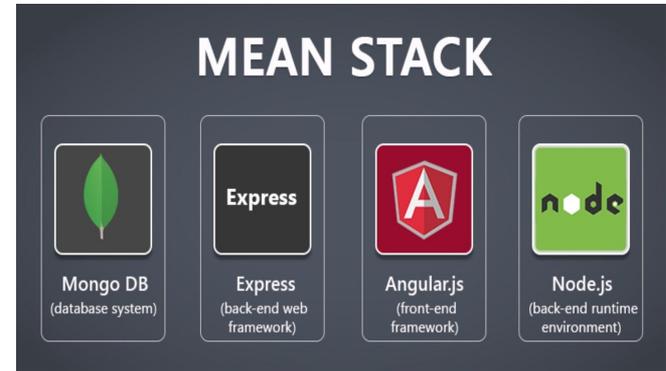

E.g CSEC and CSEC W site

- Animations
- Changing Text
- Pop ups
- Changing backgrounds
- On clicks

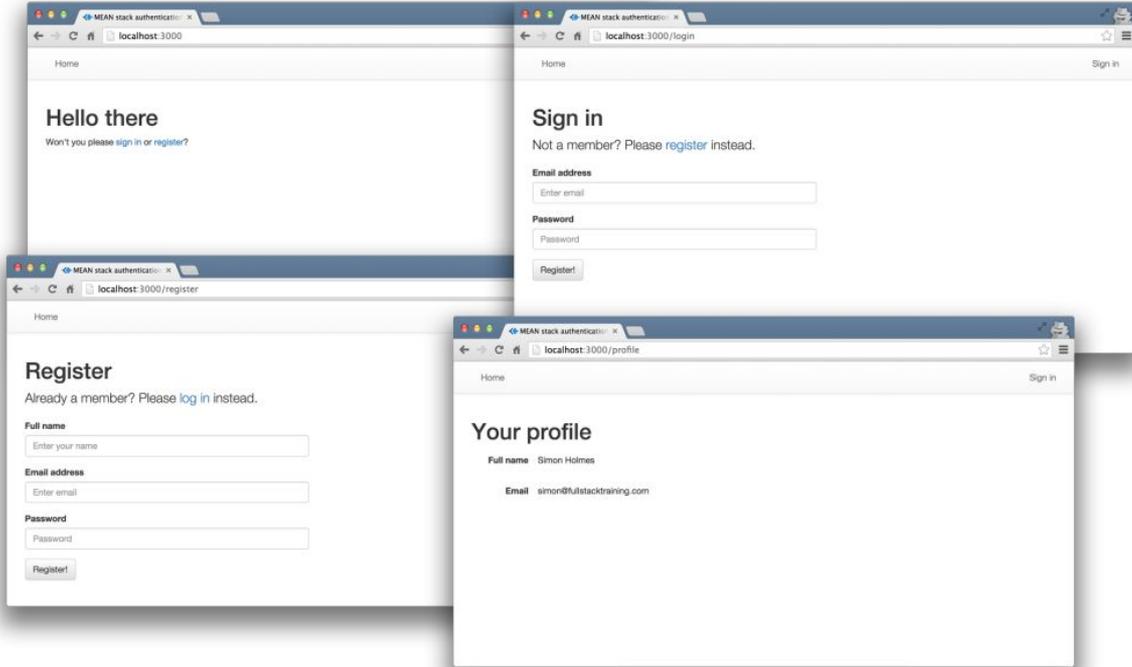

# Web Applications 03

Eg. Using the MEAN Stack

MEAN is a collection of JavaScript-based technologies — MongoDB, Express.js, AngularJS, and Node.js — used to develop web applications.

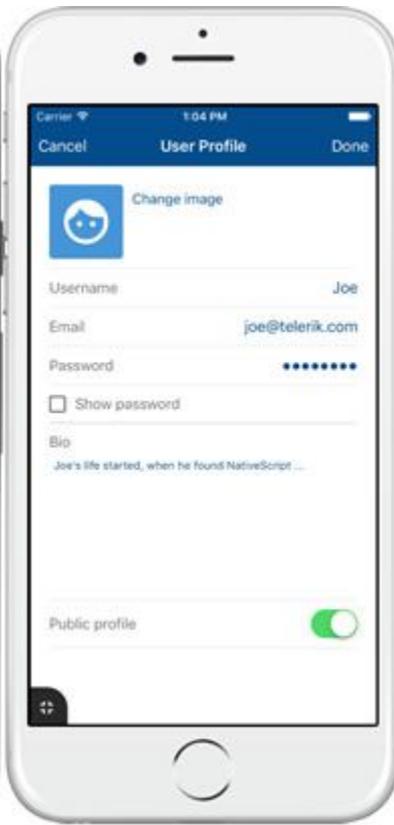

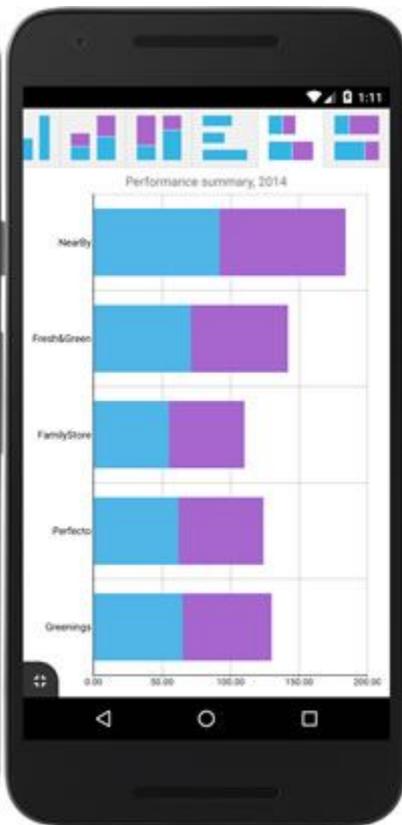

# Mobile Applications

## 03

Mobile applications can be made using Javascript technologies

# Syntax

# The syntax is very similar to what you've seen before

→ Javascript takes inspiration from many languages, most notably Python and Java

---

**Debugging:**

```
console.log("it broke");
```

**Comments:**

```
// for in line
```

```
/* multiline commenting */
```

# Variables

→ `var x, y;` // How to declare variables

→ `x = 5; y = 6;` // How to assign values

→ `z = x + y;` // How to compute values

→ `x = 3.14`

→ You can also use var to declare strings

→ NOTE: Integers, Floats, Long(Numbers) must be set to a variable before operation

# Loops

```
→ var a = 0;
   while (a<100){
       a++;
   }
   for(var a=0;a<100;a++){
       console.log(a);
   }
```

# If statements

```
if ((age<20 && name="Moe")||(age>=20)){  
    age = age + 1;  
} else if {  
    name = "Moe " + "Sucks";  
} else {  
  
}
```

# Selecting HTML elements

```
document.getElementById("id")
```

```
document.getElementsByTagName("p");
```

```
document.getElementsByClassName("class");
```

```
document.querySelector("#id .class p");
```

```
document.querySelectorAll("#id .class p");
```

**DEMO!**
